

Brain Dumpd : Project Description

What I built

Brain Dumpd is a hands-free "brain dump" task board for Snap SPECS. You tap or pinch a mic button and just talk — a stream of unstructured thoughts and the Lens turns it into an organized wall of tasks in your real space.

Under the hood:

- **Guided start.** On first run, a floating yellow post-it note explains what does what “tap the mic to talk, tasks sort into Now / Next / Later, grab a note to move it or throw it to toss it, mention a time for a reminder and then a tap begins wall placement.” While you're picking the spot, the placeholder is a matching sticky note reading "Place on a flat surface" that follows your gaze; the mic button only appears once the wall is locked in.
- **Voice → structured tasks.** Speech is transcribed on-device (ASR), then sent to an LLM (gpt-4o-mini via the Remote Service Gateway) that extracts each distinct, actionable task with a title, an urgency level (now / next / later), a category, and an optional time based reminder. A hardened local fallback parser keeps it working if the network hiccups.
- **Sticky notes on your real wall.** Tasks appear as color-coded sticky notes : coral = Now, yellow = Next, blue = Later , in three labelled columns, placed on an actual wall you pick via World Query, and persisted across sessions.
- **Natural interactions.** Grab a note to move it between columns; throw it or drag it down and it crumples into a physics paper ball (in its own colour) and drops away, deleting the task. Sweep the wall or re-anchor the board to a new wall with on-board buttons.
- **Alive, legible feedback.** While recording, a coral halo pulses with your voice volume; while the LLM thinks, three dots orbit the mic; a task with a time shows it and, when that time arrives (while you're wearing the Lens), the note rings and bounces for several seconds to get your attention.
- **A mic that goes where you do.** When you're at the board it docks on the wall; walk into another room and it detaches and follows you, so you can capture a thought anywhere and a note with a brain dump, away from the board materializes in front of you, then flies to your wall and persists there.

How it responds to the weekly theme — Week 1: Organize

Brain Dumpd takes the messiest possible input — a person thinking out loud and turns it into a clear, spatial plan. You just talk your thoughts out loud; the LLM organizes every scattered thought into a structured task and sorts it into Now / Next / Later, and those tasks become Virtual sticky notes anchored on your real wall. That's the spatial experience: your plan lives in the room around you instead of buried in a phone app sorted by urgency, glanceable, and persistent across sessions as well as alerting you when an urgent, timed task is due.

It hits all three verbs of the theme directly:

Organize — unstructured speech becomes titled, categorized, prioritized tasks on a tidy wall.

Plan — triage across the three urgency columns, and reprioritize just by grabbing a note and moving it (or throwing it away when it's done).

Be more productive — hands-free capture from anywhere in your space, timed reminders that ring when something's due, and a mic that follows you so a thought is never lost.

It's productivity designed for the space around you, not a screen but an ambient, always-available "second brain."

Who it's for

People who think out loud and get overwhelmed by keeping everything in their head - busy knowledge workers, students, parents, and anyone with an ADHD-style flood of "I need to..." thoughts. It's for the moment you have five things to remember and no hands (or patience) to type them: you just say them out loud, and they're organized and waiting on your wall.
